

Data dictionary for 'cns2012pumf'

This data dictionary associated with the file 'cns2012pumf' defines shorthand codes used for fields and values that appear in the dataset and, where applicable, provides counts for the number of responses to different options within questions.

Notes:

- 1) For brevity, the label "[populated]" is used whenever a frequency has more than 20 unique unformatted values.
- 2) Counts supplied in this codebook are based on the complete address based, web and community samples combined unless otherwise noted. To help assure confidentiality 57 Nunavut voluntary community survey responses and were removed from the PUMF. To help assure data quality nineteen web-panel respondents from Ontario that were outliers were removed from the PUMF. Counts supplied in this codebook include the above 76 (57+19) respondents. Thus, the codebook counts will be slightly higher than counts produced from the PUMF. As the removed respondents were not part of the Address sample, weighted estimates produced using the Address_Analysis_Weight will not be affected. Weighted estimates for produced using the Combined_Analysis_Weight will very slightly undercount the population.

This document was prepared November 13, 2015.

Language: In which language would you like to take the survey? Dans quelle langue voulez-vous participer à l'enquête?

Value	Count	Percent	Cumulative Count	Cumulative Percent
1-English	20431	84.8%	20431	84.8%
2-French	3674	15.2%	24105	100.0%

Total	24105			

Q1_1: Made choices in the last 12 months ...I traveled to experience more nature

Value	Count	Percent	Cumulative Count	Cumulative Percent
0-Not checked	13459	55.8%	13459	55.8%
1-Checked	10646	44.2%	24105	100.0%

Total	24105			

Q1_2: Made choices in the last 12 months ...I purchased products and services that are more environmentally friendly than their competitors

Value	Count	Percent	Cumulative Count	Cumulative Percent

Census_Urban - Urban vs rural postal code as defined by Canada Post

Value		Count	Percent	Cumulative Count	Cumulative Percent
1	Urban	19861	82.4%	19861	82.4%
2	Rural	4244	17.6%	24105	100%

Total		24105	100%		

Important notes regarding the weight values provided in the file ‘cns2012PUMF’:

Responses to the 2012 Canadian Nature Survey were weighted to ensure that survey estimates would be representative of the Canadian population. Two sets of weights were computed: one “address” weight for data analysis from the address-based probability sample and a second “combined” analysis weight to support analyses of Web panel and opt-in responses. Both the address-based and combined sample weights will estimate similar population totals and distributions with respect to the variables used in the calibration adjustments. The difference between the address-based sample weight and the combined sample weight is that the former is based on a probability sample and can be relied upon for estimates and analyses that seek to draw conclusions about the Canadian population with quantifiable precision using standard procedures. The combined weight provides representative estimates with precision that cannot be estimated using standard procedures. That is, variances from the address-based sample can be estimated, but not, given standard statistical methodologies, from the combined sample. The two weights allow two general types of analysis to be conducted. It is recommended that the choice of weight be based on the user’s goals:

- The address-based sample weight can be used for analyses that require confidence intervals (e.g., population estimates) or statistical testing.
- The combined sample weight can be used for analyses that do not require confidence intervals or statistical tests (which require variance estimates). These data provide a representative set of responses from Canadian adults whose statistical reliability cannot be quantified.

For more information, please see the section entitled Survey Methods in the report *2012 Canadian Nature Survey: Awareness, participation, and expenditures in nature-based recreation, conservation, and subsistence activities*

Address_Analysis_Weight – Address-based sample weight

The weighting approach for the address-based sample is made up of two components: a sampling weight, which adjusts for unequal selection probabilities due to the stratified design, and a calibration adjustment, which adjusts for survey non-response and calibrates the weights to known population totals.²² The sampling component of the address-based weight is the inverse of the probability of selecting a given residence from the Canada Post address file within each sampling stratum. The sampling component was then calibrated (or post-stratified) to known population totals. This adjustment was made along the following dimensions:

- Age (independently within each province and territory)
- Gender (independently within each province and territory)
- Urban/Rural (independently within each province and territory)
- Aboriginal/non-Aboriginal identity

The result of this adjustment is the final address-based sample weight.

For more information, please see the section entitled Survey Methods in the report *2012 Canadian Nature Survey: Awareness, participation, and expenditures in nature-based recreation, conservation, and subsistence activities*

Combined_Analysis_Weight – Combined (mixed-sample method) sample weight

The weighting approach for the combined sample has two components: a sampling component based on an estimated probability of selection for each respondent, and a calibration adjustment, which adjusts the first component to known population totals. The unknown selection probability for individuals responding from the Web panel and opt-in samples is estimated by modelling their propensity of inclusion in these samples using three stages. First, the address selection probability of each case was estimated as if it were selected via the address-based sampling mechanism. This is the same as the address-based probability for respondents in the address-based sample.

Second, the probability of being selected for the Web panel sample¹ was estimated by the modelled probability of being included in the panel data. That is, the event of responding via the non-probability sample is taken as the event of being sampled for the non-probability sample. The modelling relies on logistic regression to predict propensity of inclusion based on geographic location and most survey responses. In provinces and territories where both an address-based sample and Web panel sample were used, logistic regression was used to combine respondents from the Web panel survey and respondents from the address-based sample who responded on the Web. Predictor variables included response and demographic data obtained from survey responses, as well as the stratification variables. Logistic regression yields a probability of being selected for the panel for each respondent (not just those who answered using the Web).

¹ The selection process for both inclusion into the general Web panel, and for participation in this survey, are proprietary processes employed by the third party Web survey vendors.

Finally, the third step accounted for the fact that there were now two probabilities of selection (address-based and panel propensity). The two probabilities were combined through a procedure known as cumulating cases.^{2,3} This procedure calculates the probability of a respondent being selected for the address-based sample, the panel propensity sample, or both. The sampling component of the combined sample weight becomes the inverse of this estimated probability of selection. For the Northwest Territories and Nunavut community opt-in survey, a constant selection probability was assumed. To produce the combined analysis weight, the sampling component of the combined sample weight was then calibrated (or post-stratified) to known population totals, using the approach described above for the address-based sample weight for Web surveys.

For more information, please see the section entitled Survey Methods in the report *2012 Canadian Nature Survey: Awareness, participation, and expenditures in nature-based recreation, conservation, and subsistence activities*.

PUMFID – unique identifier for each record

Count	Percent
24029	100%

*Counts for the PUMFID table reflect the 76 records removed from the file ‘cns2012PUMF’.

Please see note 2) on the first page of this data dictionary for more information.

AgeClass – year of birth recoded to five-year age group

Value	Age based on reported year of birth
1	Less than 20
2	20 to 24
3	25 to 29
4	30 to 34
5	35 to 39
6	40 to 44
7	45 to 49
8	50 to 54
9	55 to 59
10	60 to 64
11	65 to 69
12	70 to 74
13	75 to 79
14	80 to 84
15	85 to 89
16	90 and older
77	Invalid response
88	Nothing checked

*The table AgeClass defines reclassified age values. The 2012 Canadian Nature Survey asked respondents to provide their year of birth. To protect respondents’ confidentiality, this data has been reclassified to five-year age groups.
